

## USING A COLLAGED PERSPECTIVAL VIEW TO MAKE AN ARGUMENT ABOUT AN INTERVENTION ON DORCHESTER AVE, SOUTH BOSTON

### VIEW 1: PHYSICAL INTERVENTIONS

The image above shows an intervention plan for interstitial spaces along Dorchester Ave in South Boston. The interventions are designed to be low-cost while addressing community needs, including congregating spaces, urban greenery, and public art.

These physical interventions help create a more inviting space but do not clearly identify how the spaces may be activated with programming.

### VIEW 2: PROGRAM INTERVENTIONS

The image above shows the same physical interventions layered with programming to imagine how these spaces may be activated socially and economically. A mix of activities were chosen to imagine how the space may serve as both a destination and as part of a vibrant corridor.

This collaged perspective helps a viewer visualize how the space will look and be used. It is important to note how the uses pictured here may or may not be representative of how the community may leverage the space. Vendor activity was chosen to show here because it was a need shared in a virtual site visit for this corridor; however, the types of vendors pictured here may need to be modified to better reflect community visions.
